# Amazon Bedrock Security and Privacy

Amazon Bedrock helps you keep your data and applications secure and private

## IAM Permissions

Amazon Bedrock ▼

### Runtime role

- ☐ Create and use a new service role
- ☒ Use an existing service role

AmazonBedrockExecutionRoleForAgents\_AgentTestRole

## Idle session timeout

You can configure how long a session is maintained when the user does not provide any input information until a session ends.

### Session timeout

30

Minute(s)

By default, session duration is 30 minutes, but you can specify any duration between 1 and 60 minutes.

## Secure your generative AI applications

With Amazon Bedrock, you have full control over the data you use to customize the foundation models for your generative AI applications. Your data is encrypted in transit and at rest. Additionally, you can create, manage, and control encryption keys using the AWS Key Management Service (AWS KMS). Identity-based policies provide further control over your data, helping you manage what actions users and roles can perform, on which resources, and under what conditions.

## Build with comprehensive data protection and privacy

Amazon Bedrock helps ensure that your data stays under your control. When you tune a foundation model, we base it on a private copy of that model. This means your data is not shared with model providers, and is not used to improve the base models. You can use AWS PrivateLink to establish private connectivity from your Amazon Virtual Private Cloud (VPC) to Amazon Bedrock, without having to expose your VPC to internet traffic. Finally, Bedrock is in scope for common compliance standards including ISO, SOC, CSA STAR Level 2, is HIPAA

eligible, and customers can use Bedrock in compliance with the GDPR. Amazon Bedrock is a FedRAMP High authorized service in the AWS GovCloud (US-West) Region.

### CloudWatch Logs configurations

#### Log group name

Invocation logs and model input & output data of up to 100 KB each will be published to this log group.

#### Choose a method to authorize bedrock

- ☒ Use an existing service role
- ☐ Create and use a new role

#### Service role

Choose role

Model input or output data larger than 100kb or in binary format will not be published to CloudWatch Logs. If S3 configuration for large data delivery is enabled, the data will be published to S3.

## Implement governance, and auditability

Amazon Bedrock offers comprehensive monitoring and logging capabilities that can support your governance and audit requirements. You can use Amazon CloudWatch to track usage metrics and build customized dashboards with metrics that can be used for your audit purposes. You can also use AWS CloudTrail to monitor API activity and troubleshoot issues as you integrate other systems into your generative AI applications. You can also choose to

store the metadata, requests, and responses in your Amazon Simple Storage Service (Amazon S3) bucket, as well as to Amazon CloudWatch Logs. Finally, to prevent potential misuse, Amazon Bedrock implements [automated abuse detection](#) mechanisms.
